Architectural Integration of Solar PV into Building Design
Agenda

2. Design Considerations to Maximize Solar Potential
New Construction is the Best Opportunity to Consider PV
Benefit of incorporating PV into new construction

- Lower upfront cost of installation
- Service panel design to incorporate 100% electric load

Benefit of incorporating PV into new construction

Design can include other sustainable technologies
Benefit of incorporating PV into new construction

- Roof tilt and azimuth can be designed for optimal sun exposure
- Efficient conduit runs that have been predetermined
Figure 3. About half of all commercial buildings were constructed before 1980.

Existing Structures - Design Considerations

- Age of roof (roof replacement = ideal time)
- Shading by adjacent buildings/trees
- Design for energy efficiency FIRST to reduce cost of solar
Design Considerations to Maximize Solar Potential
FIRST – Design for Energy Efficiency (EE)

• Efficient building construction
• Efficient systems and appliances
• Operations and maintenance
• Change in user behavior
• Natural daylighting
• Natural ventilation
Energy efficiency first
All EE things you should do first

• FOCUS on energy efficiency – it’s CORE to modern architecture
• Drive down demand as low as possible – extremely important; you’ll need fewer panels and drive down the cost of solar
• Consider orientation! Face south!
• Use daylighting so you need fewer light bulbs
Designing a Zero Energy Building

**STEP 1** Increase energy efficiency

- Efficient building construction
- Efficient systems and appliances
- Operations and maintenance
- Change in user behavior

**STEP 2** Address remaining needs with on-site renewable energy generation

- Wind
- Solar
- Hydro Energy

Photo credit: EERE
A Zero Energy Building (ZEB) is an energy-efficient building where, on a source energy basis, the actual annual delivered energy is less than or equal to the on-site renewable exported energy.

Solar PV gives points for rating systems
Solar PV design considerations

- Building orientation
- Tilt of system
- Site layout
- Shading from other structures and landscape
Building orientation – run long axis east/west to give large southern exposure
Solar PV design considerations - ORIENTATION

In the last few hours of daylight, west-facing PV panels have an advantage over south-facing panels as they're tilted towards the setting sun.

Photo credit: EERE
Solar PV design considerations - TILT

Maximum solar production can be achieved when the PV panels are tilted towards the sun.

Photo credit: EERE
Design considerations: TILT for ground mounted Tracking can maximize solar production by tracking the sun’s position

Solar PV design considerations: TILT

Solar PV output depends on orientation, tilt and tracking

Simulated energy production of one kilowatt of solar PV capacity in Los Angeles, Calif.

- tracking, dual-axis: 2,078 kilowatthours
- no tracking, tilted south: 1,566 kilowatthours
- no tracking, tilted west: 1,403 kilowatthours
- no tracking, tilted east: 1,332 kilowatthours
- no tracking, flat: 1,402 kilowatthours

Site layout can determine the feasibility of solar PV
Solar PV design considerations - SHADING

Shading will play a major role in the available area for the desired system size

Photo credit: NREL
Shading greatly affects solar PV production
Strategies to prevent self-shading
Design to Minimize Shading

Lose the **shaded** cell’s production

Interconnect ribbons
Design to Minimize Shading

Interconnect ribbons

Lose the entire module’s production

Design to Minimize Shading

Calculation for inter-row spacing:

\[ d = h \div \tan a \]

- \( d \) = minimum distance between rows
- \( h \) = height differential between the top of the panel and the ground
- \( a \) = solar altitude angle
Design to Minimize Shading

\[ d = h \div \tan \alpha \]
Design to Minimize Shading

Solar altitude angle (angle “a”) NOAA Solar Calculator

U.S. Department of Energy
Assume $h = 24''$ and $a = 27^\circ$, find $d$

$$d = h \div \tan a$$
Example calculation for inter-row spacing:

\[ d = h \div \tan a \]

\[ 48 \text{ in} = 24 \text{ in} \div \tan 21^\circ \]
Solar PV design considerations – ENERGY USE

How much energy will this building use?

Photo credit: Autodesk
How much roof area do I need for PV panels?

Rule of Thumb
1kW = approx. 100 sf
Solar PV design considerations – SYSTEM SIZE

How can I approximate the system size?

Use calculator
• PV Watts
• System Advisor Model (SAM)
